(54) Title: DIAGNOSTIC IMAGING CONTRAST AGENT WITH IMPROVED IN-SERUM-RELAXIVITY

### (57) Abstract

Compounds of formula (I), both in the racemic and optically active forms in which R is H, or a linear or branched, saturated or unsaturated C<sub>1</sub>-C<sub>20</sub> alkyl, optionally interrupted by one or more -CH(OH)-, -CONH-, -NHCO-, -CO-, -CH(NH<sub>2</sub>)-, -SO-, -SO<sub>2</sub>-, SO<sub>2</sub>NH- groups and/or one or more N, O, S atoms optionally substituted with one or more -COOH groups and/or amide or ester derivatives thereof, and in which said alkyl chain is interrupted or substituted by at least 2, which are independently the same or different, isolated or fused, cyclic L residues, with the proviso that, when some L residues are fused together, the resulting polycyclic unit

comprises no more than 3 cyclic group, and in which L is a carbocyclic or heterocyclic, saturated or unsaturated or aromatic cyclic unit, comprising from 5 to 6 atoms, optionally substituted by one or more X groups, which are independently the same or different, in which X is OH, halogen, NH2, NHZ, N(Z)2, -OZ-, -SZ-, COZ, where the Z groups can independently be a C<sub>1</sub>-C<sub>5</sub> linear or branched alkyl, optionally substituted with one or more -OH, -COOH or alkoxy groups, or said X group is a -COOH group or a derivative thereof, such as an ester or an amido group, or -SOZH group or an amino derivative of the same; R<sub>1</sub> is the same as R with the provisos that: R and R<sub>1</sub> cannot be at the same time H; when R is different from H, R<sub>1</sub> is H; when R<sub>1</sub> is different from H, R is H; as well as the complexes of the compounds of fornula (I) with metal ions of atomic number from 20 to 31, 39, from 42 to 44, 49 and from 57 to 83 and the salts thereof bases the cations of which are sodium, potassium, magnesium, calcium or the mixtures thereof. Said compounds are useful as contrast agents in Magnetic Resonance Imaging and have improved relaxivitty in human serum.

# DIAGNOSTIC IMAGING CONTRAST AGENT WITH IMPROVED IN-SERUM-RELAXIVITY

# Technical field of the invention

This invention relates to the Magnetic Resonance Imaging (M.R.I.), a technique used in the medical diagnosis field for a number of years, to rapidly detect a series of anomalies and/or pathological conditions of living human or animal body organs or tissues. (i. e.: Stark D.D., Bradley W.G. Jr., Eds. : "Magnetic Resonance Imaging", the C.V. Mosby Company, St. Louis, Missouri (USA), 1988). In particular, the invention relates to new chelating agents, especially 10 aminopolycarboxylic acid derivative compounds and to metal chelates thereof with bivalent or trivalent paramagnetic ions and/or salts thereof as well as their use as M.R.I. contrast agents.

#### Background of the invention 15

5

20

25

Diagnostic imaging techniques, such as Magnetic Resonance Imaging, have been used in medical diagnosis for a long time. The use of contrast media to improve tissue differentiation, to delineate structures or monitor physiological functions constitutes in some cases a fundamental contribution in the best formulation of some medical diagnosis and a valid support for radiologist work.

The medical use of aminopolycarboxylic acid or carboxylic acid derivatives and metal chelates thereof as M.R.I. contrast agents is well known. Said contrast agents, to simplify, can be seen as pertaining to two main groups: the linear and the cyclic ones.

2

The present invention relates to linear polyaminopolycarboxylic acid derivatives, as well as their complexes with paramagnetic metal ions, in particular the  $Gd^{3+}$  ion.

5 Patent literature is rich in patent and patent applications relating to the use of linear polyaminopolycarboxylic acid derivatives in the preparation of MRI contrast agents. These compounds generally are derived from the simplest 10 N, N, N', N'', N''-diethylenetriamine-pentaacetic (DTPA), of which the Meglumine salt of the Gd3+ complex has been commercialised for a number of years as MAGNEVIST(R). To improve stability, water solubility and selectivity and to reduce toxicity of these contrast 15 generally patent agents literature proposes preparation of esters or amido derivatives of said acids or the introduction of substituents on the diethylene unit of the diethylenetriamine DTPA skeleton. As an example of said patent literature we can cite: Guerbet 20 EP 661279; Concat Ltd., WO 95/05118; Dibra WO 95/15319; Mallinckrodt WO 94/08630; Green Gross Corp. JP 06016606 and JP 05229998; Mallinckrodt US 5,141,740 and US 5,077,037; Cockbain-Nycomed WO 91/15467 and WO 92/11232; Salutar US 4,889,931 and 4,858,451; Abbot Laboratoires 25 EP 279307; Nycomed EP 299795; Metasyn Inc. WO 95/28179: Schering EP 680 464; and document cited in these patent publications. Some documents further exist in which substituents have been introduced in a to one or more carboxylic DTPA groups; for example: Bracco EP-B-230893 and US 5,182,370; Schering WO 96/16928, WO 96/16929, WO 30 96/26180 and DE 4341724 enclosing a derivatives,

3

generally comprising an aromatic group, particularly useful for the imaging of the hepatobiliary system. In particular, some patent literature further exist, in which the introduction of an aromatic or lipophilic group on the chelant structure is specifically stated to make the contrast agent particularly useful for a best definition of the liver and the biliary duct: the General Hospital Corporation US 4,899,755 and WO -A-86/06605.

# 10 Summary of the invention

5

15

20

25

30

The compounds of the present invention are diethylenetriaminepentaacetic acid derivatives characterised by having a hindering group in a to at least one of the 5 DTPA carboxylic groups wherein said substituent has the dimension of a  ${\rm C_1-C_{20}}$  alkyl, linear or branched, saturated or unsaturated chain, which is substituted or interrupted by at least two cyclic, optionally aromatic, carbocyclic or eterocyclic, saturated or unsaturated, isolated or fused units.

Said hindering group is probably responsible for the interaction of the paramagnetic chelates with biological components of the fluids in which the agent diffuses, wherein said interaction produces the surprisingly high relaxivity values that we have measured in Human Reconstructed Serum.

Relaxivity values of the contrast agent of the present invention have been tested either in saline or in human serum obtained by Seronorm<sup>TM</sup> Human, freezedried human serum produced by Nycomed Pharma AS, Oslo, Norway. Serum obtained from said Seronorm<sup>TM</sup> is substantially equivalent to the fresh one, so its use in

4

the relaxivity determination grants a good picture of the "in vivo" behaviour and, further, an excellent reproducibility of this test.

The compounds object of the present invention are characterised by very high  $r_1$  and  $r_2$  relaxivity values. When measured in Seronorm<sup>TM</sup> Human at 20 MHz, at a temperature of 39°C, and at a concentration comprised from 0 to 1 mM, compounds of the present invention usually have  $r_1$  relaxivity equal to or, preferably, higher than 15 s<sup>-1</sup>mM<sup>-1</sup>.

# Detailed disclosure of the invention

The present invention relates to novel chelating agents, more particularly linear aminopolycarboxylic acid derivatives chelants, and metal chelates thereof and the use of such chelating agents and chelates in the preparation of diagnostic imaging contrast agents and in particular of contrast agents exhibiting improved serum relaxivity.

Said compounds are polyaminopolycarboxylic acid derivatives of formula (I)

in which :

5

10

15

25

R is H, or a linear or branched, saturated or unsaturated  $C_1-C_{20}$  alkyl, optionally interrupted by one or more -CH(OH)-, -CONH-, -NHCO-, -CO-,

5

-CH(NH<sub>2</sub>)-, -SO-, -SO<sub>2</sub>-, SO<sub>2</sub>NH- groups and/or one or more N, O, S atoms, optionally substituted with one or more -COOH groups and/or amide or ester derivatives thereof, and in which said alkyl chain is interrupted or substituted by at least 2, which are independently the same or different, isolated or fused, cyclic L residues, with the proviso that, when some L residues are fused together, the resulting polycyclic unit comprises no more than 3 cyclic group, and in which

- L is a carbocyclic or heterocyclic, saturated or unsaturated or aromatic cyclic unit, comprising from 5 to 6 atoms, optionally substituted by one or more X groups, which are independently the same or different, in which
- x is OH, halogen, NH<sub>2</sub>, NHZ, N(Z)<sub>2</sub>, -OZ-, -SZ, -COZ, where the Z groups can independently be a  $C_1-C_5$  linear or branched alkyl, optionally substituted with one or more -OH, -COOH or alkoxy groups,
- or said X group is a -COOH group or a derivative thereof, such as an ester or an amido group, or an -SOZH group or an amido derivative of the same;

 $R_1$  is the same as R with the provisos that: R and  $R_1$  cannot be at the same time H;

when R is different from H,  $R_1$  is H; when  $R_1$  is different from H, R is H.

5

10

15

The compounds comprised within formula (I) can be either racemic or optically active.

The invention further comprises complexes of the ligand of formula (I) with metal ions of atomic number from 20 to 31, 39, from 42 to 44, 49 and from 57 to 83;

5

6

particularly preferred metals being:  $Fe^{(2+)}$ ,  $Fe^{(3+)}$ ,  $Cu^{(2+)}$ ,  $Cr^{(3+)}$ ,  $Gd^{(3+)}$ ,  $Eu^{(3+)}$ ,  $Dy^{(3+)}$ ,  $La^{(3+)}$ ,  $Yb^{(3+)}$ ,  $Mn^{(2+)}$ ; as well as, where the metal chelate carries an overall charge, a salts—thereof with a physiologically acceptable counterion, preferably selected from organic bases—such as a primary, secondary or tertiary amines, a basic amino acid, or an inorganic base derived from an alkali metal or alkaline-earth metal cation such as:  $Na^+$ ,  $K^+$ ,  $Mg^{2+}$ ,  $Ca^{2+}$  or a mixture thereof.

The present invention further relates to the use of the compounds of formula (I) and of the salts of the complexes thereof as well as the pharmaceutical formulations containing them for a diagnostic or therapeutic scope.

Preferred are the compounds of formula (I) in which R or  $R_1$  are selected from the following groups:

7

PCT/EP97/03997

٤

Among the compounds of formula (I) particularly preferred are the ones of formula (II),

HO O OH R O OH OH OH

in which R1 is H and R is as defined above in formula (I), but is different from H.

Among compounds of formula (II), preferred are the compounds of formula (III):

15

20

5

$$R'$$
 $R'$ 
 $(CH_2)_n$ 
 $R'$ 
 $(CH_2)_m$ 
 $R'$ 
 $(CH_2)_m$ 
 $(CH_2)_m$ 
 $(COOH_2)_m$ 
 $(COOH_2)_m$ 

25 wherein:

R' = independently H, halogen;

 $R'_1 = H$ , OH,  $N(R'')_2$ , COOR",  $-CON(R'')_2$ ,  $-SO_3H$ ,  $-SO_2NHR''$ ,  $C_1-C_6$  alkyl,  $C_1-C_6$  alkoxy;

A = direct bond (i.e. non intervening atom), -O-, C=O

30 m = integer 1-6;

n = integer 0-2;

9

R" = independently H or  $C_1-C_5$  linear or branched alkyl, optionally substituted with 1 to 5 -OH groups:

with the proviso that, when  $R'_1 = H$ , at least one of the substituents R' is different from hydrogen.

Among compounds of formula (III), particularly preferred are the compounds of formula (IV)

10 R' + R' R

20 where:

R' = independently H, halogen;

 $R'_1 = H$ , OH,  $N(R'')_2$ , COOR",  $-CON(R'')_2$ ,  $-SO_3H$ ,  $-SO_2NHR''$ ,  $C_1-C_6$  alkyl,  $C_1-C_6$  alkoxy;

m = integer 1-6;

25 R" = independently H or  $C_1$ - $C_5$  linear or branched alkyl, optionally substituted with 1 to 5 -OH groups; with the proviso that at least one of the substituents R' is different from hydrogen, as well as compounds of formula (V)

10

where:

5

10

 $R'_1 = OH$ ,  $N(R'')_2$ , COOR'',  $-CON(R'')_2$ ,  $-SO_3H$ ,  $-SO_2NHR''$ ,  $C_1-C_6$  alkyl,  $C_1-C_6$  alkoxy;

m = integer 1-6;

R" = independently H or  $C_1-C_5$  linear or branched alkyl, optionally substituted with 1 to 5 -OH groups.

Among compounds of formula (II), preferred are also those of formula (VI)

(VI)

where:

30  $R_2 = C_1-C_8$  alkyl, optionally interrupted by one or more -CONH-, -NHCO-, -CO- groups and/or N, S atoms,

11

optionally substituted with -OH, -COOH, -NH<sub>2</sub>, -N(R")<sub>2</sub> groups, said alkyl being interrupted or substituted with a polycyclic unit comprising from 2 to 3 saturated or unsaturated or aromatic fused rings, said polycyclic unit being interrupted by one or more N, O, S and optionally substituted with -OH, -COOH, -NH<sub>2</sub>, -N(R")<sub>2</sub>,  $C_1$ - $C_6$  alkyl,  $C_1$ - $C_6$  alkoxy,  $C_6$ - $C_{20}$  arylalkoxy groups;

R'' = independently H or  $C_1$ - $C_5$  linear or branched alkyl, optionally substituted with 1 to 5 -OH groups;

and particularly preferred are the compounds of general formula (VII)

15

10

5

20

25

(VII)

in which:

 $R_3$  = a polycyclic unit comprising from 2 to 3 saturated or unsaturated or aromatic fused rings, said polycyclic unit being interrupted by one or more N, O, S and optionally substituted with -OH, -COOH, -NH<sub>2</sub>, -N(R")<sub>2</sub>,  $C_1$ - $C_6$  alkyl,  $C_1$ - $C_6$  alkoxy,  $C_6$ - $C_{20}$  arylalkoxy groups;

R" = independently H or  $C_1-C_5$  linear or branched alkyl, optionally substituted with 1 to 5 -OH groups;

12

n = integer 1-6.

Two further groups of preferred compounds, comprised within formula (II), are the compounds of formula (VIII)

5

$$R_4$$
 $(CH_2)_n$ 
 $O \nearrow N$ 
 $(CH_2)_n \longrightarrow R_4$ 
 $O \nearrow N$ 
 $(CH_2)_m \longrightarrow R_4$ 
 $O \nearrow N$ 
 $O$ 

10

in which:

m = integer from 1 to 4;

n = independently integer from 0 to 2;

15  $R_4$  = independently saturated, unsaturated or aromatic ring, optionally interrupted by one or more N, O, S atoms and optionally substituted with one or more -OH, -COOH, -NH<sub>2</sub>, -N(R")<sub>2</sub>, -CON(R")<sub>2</sub>, -SO<sub>3</sub>H;

R" = independently H or  $C_1-C_5$  linear or branched 20 alkyl, optionally substituted with 1 to 5 -OH groups;

and the compounds of formula (IX)

HN  $R_s$ HOOC N N COOH

HOOC N N COOH

(IX)

30 in which:

 $R_5 = C_1 - C_3$  alkyl, interrupted or substituted with 2 to

13

3 saturated, unsaturated or aromatic, isolated or fused rings, that are optionally interrupted by one or more N, O, S and optionally substituted with one or more -OH, -COOH,  $-NH_2$ ,  $-N(R'')_2$ ,  $-CON(R'')_2$ ,  $-SO_2H$ :

5  $-SO_3H$ ;

R'' = independently H or  $C_1-C_5$  linear or branched alkyl, optionally substituted with 1 to 5 -OH groups;

m = 1-6.

Among compounds of general formula (IX), particularly preferred are the compounds of formula (X)

HN 
$$C(H)_p - (R_e)_n$$

HOOC N N COOH

HOOC COOH

20 in which:

R<sub>6</sub> = saturated, unsaturated or aromatic 5- or 6membered ring, optionally interrupted by one or
more N, O, S;

m = 1-6;

25 n = 2 or 3;

p = 0 or 1;

with the proviso that p+n=3.

Among the compounds of formulae (III) and (IV), most preferred are the compounds from 1 to 3 of formula:

30

PCT/EP97/03997

Among the compounds of formula (V), most preferred is compound 4 of formula:

20

15

Among the compounds of formula (VI), most preferred is compound 5 of formula:

30

15

Among the compounds of formula (VII), most preferred is compound 6 of formula:

Among the compounds of formula (VIII), most preferred are compounds 7 and 8, respectively of

and among the compounds of formulae (IX) and (X), most preferred are compounds from 9 to 11 of formulae

respectively.

5

15

30 The preparation of the compounds of the present application comprises the regiospecific introduction of

16

the hindering substituent in a to a carboxylic group of the acetic acid bound to the central nitrogen atom of DTPA.

One of the preferred synthetical ways used refers to that introduced by Rapoport (J. Org. Chem. 1993, 58, 1151-1158), starting from natural or synthetical qamino acid derivatives. An alternative way comprises the use of synthons such as glutamic acid or lysine, which allows the introduction of hindering groups quite distant from the carbon atom in a to a carboxylic group of the central acetic acid residue, exploiting the terminal acid or amino functions, respectively, of a.m. amino acids.

Starting from suitable precursor synthons it is also possible make use of the synthesis disclosed in US 5,514,510.

15

20

As far as the introduction of the hindering substituent at the  $\alpha$ - position to the carboxylic group of one of the acetic groups bound to the side nitrogen atoms of DTPA is concerned, the synthesis scheme below can be followed:

25 R<sub>1</sub> N COO P B<sup>Z4</sup>
OOC N N COO COO COO (4)

wherein  $R_1$  is as defined above for compounds of general formula (I).

18

The synthesis comprises the following steps:

- (a) precursor (1), wherein X = Cl, Br or other leaving groups, is reacted with a diethylenetriamine excess in water, at a temperature of about  $50^{\circ}C$ , to obtain almost selectively compound (2), which is reacted in step
- (b) with sodium bromoacetate in water at pH 10, to give the pentaacid (3), which is reacted, in the subsequent step
- (c) with a suitable oxide or salt of a metal having atomic number comprised from 20 to 31, 39, from 42 to 44, 49 and from 57 to 83 (such as  $Gd_2O_3$ ,  $GdCl_3$ ) e with the appropriate amount of a physiologically acceptable organic base (such as meglumine) or of an inorganic base the cations of which are sodium, potassium, magnesium, calcium, or mixtures thereof, to give the final compound (4),

### wherein:

5

20

 $Me^{n+}$  = ion of the metal element having atomic number comprised from 20 to 31, 39, from 42 to 44, 49 and from 57 to 83 (such as  $Gd^{3+}$ );

n = number of the positive charges of said ion;

m = number of the overall negative charges of the metal
chelate;

 $B^{Z+} = Na^+, K^+, Mg^{++}, Ca^{++}$  or mixtures thereof, or it is

25 the salt of a physiologically acceptable organic base;

z = number of the positive charges of B:

p = an integer so that: p x z = m.

22

Table 1 above discloses the high relaxivity shown in serum by the compounds of the present application;  $r_1$  and  $r_2$  relaxivity values of some of the preferred compounds are reported, in comparison with the corresponding  $r_1$  and  $r_2$  values measured for some of the mayor prior-art compounds: Gd-DTPA Dimeglumine salt (MAGNEVIST<sup>(R)</sup>); Gd-BOPTA Dimeglumine salt and Gd-EOB-DTPA Dimeglumine salt.

The data of Table 1 clearly show that the compounds of the present invention have surprisingly high relaxivity values  $r_1$  and  $r_2$ , measured in Seronorm<sup>TM</sup> Human.

This is particularly interesting from the application point of view, both as far as the improvement in the obtainable images, the development of formulations specific to particular districts and the determination of optimum low dosages of the contrast medium are concerned.

## EXAMPLE 1

5

15

20

N-(2-bromoethyl)-N-[2-(1,1-dimethylethoxy)-2-oxoethyl]glycine 1,1-dimethylethyl ester

Ethanolamine (15.15 g; 0.25 mol) was dropped in 10 minutes into a suspension of t-butyl bromoacetate (112.3 g; 0.58 mol) and KHCO<sub>3</sub> (62.57 g; 0.62 mol) in DMF (400 mL), maintained at 0°C under inert atmosphere. After 22 h at 20°C the suspension was diluted with a saturated solution of NaHCO<sub>3</sub> (400 mL) and Et<sub>2</sub>O (400 mL). After separation, the aqueous phase was extracted with Et<sub>2</sub>O

23

(800 mL); the organic phases were collected, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. The obtained oil (100 g) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (700 mL), then triphenylphosphine was added (79,76 g; 0,30 mol). To the solution, cooled to 0°C, solid NBS was slowly added (53,4 g; 0,30 mol). After 2.5 h the solution was concentrated to dryness and diluted with Et<sub>2</sub>O (500 mL); the salts were filtered off, the solution was diluted with Et<sub>2</sub>O (500 mL), then left at 4°C for 16 h. The salts were filtered off and the solution was concentrated; the oily residue (100 g) was purified by flash chromatography (silica gel; 95:5 n-hexane/EtOAc). The fractions having comparable purity were collected and evaporated to dryness, obtaining the desired compound (57 g; 0,16 mol). Yield 65%.

A) N-[(Phenylmethoxy)carbonyl]-L-glutamic acid

A suspension of L-glutamic acid (23.5 g; 160 mmol) in H<sub>2</sub>O (100 mL) was stirred, maintaining the pH at 8.5 with 10 M NaOH until complete dissolution. Benzyl chloroformate (35 g; 205 mmol) was added over 15 min to the clear solution. The mixture was stirred, maintaining the pH at 9 by adding 10 M NaOH until the reaction was complete. The cloudy mixture was washed with Et<sub>2</sub>O (3x150 mL) and then the pH of the resulting solution was adjusted to 2.1 with 1 M HCl. The cloudy aqueous mixture was extracted with Et<sub>2</sub>O (2x200 mL), the organic layers were collected and evaporated to yield the desired product (39.13 g; 139 mmol). Yield 87%.

[[N,N-Bis[2-[bis(carboxymethyl)amino]ethyl]-O-(4-hydro-xyphenyl)-3,5-diiodo-L-tyrosinato(5-)]gadolinate(2-)] dihydrogen compound with 1-deoxy-1-(methylamino)-D-glucitol (1:2)

A) O-(4-Hydroxyphenyl)-3,5-diiodo-L-tyrosine methyl ester

A 6 M solution of HCl in MeOH (8 mL; 4.8 mmol) was added to a suspension of O-(4-hydroxyphenyl)3,5-diiodo-L-tyrosine (2.12 g; 5 mmol) (prepared according to: Chalmers J.R., Dickson G.T., Elks J. and Hems D.A., "The Synthesis of Thyroxine and Related Substances", Part V., J. Chem. Soc. (1949), 3424-3433) in MeOH (12 mL). The resulting clear solution was stirred for 4 days at 20°C. Then a NaHCO<sub>3</sub> satured aqueous solution was added to the mixture until pH 7 was reached, obtaining a precipitate which was filtered. By concentration of the solution a second crop of precipitate was obtained. The two samples were combined and dried (50°C; 1.3 kPa) to give the

32

desired compound (2 g; 3.7 mmol). Yield 87%.

Sample concentration:  $10 \text{ mg mL}^{-1}$ ;

5 Instrumentation: Merck KGaA Prepbar 100

The two crude ligands were separately suspended in water (250 mL) and dissolved by the addition of 10 M NaOH up to pH 6. Acidification of the two solutions to pH 2.5 with 37% HCl led to formation of two precipitates which were filtered and dried (50° C; 1.3 kPa; P205) to yield the product (B1) (3,1 g; 3.2 mmol; yield 21%) and (B2) (2.7 g; 2.5 mmol; yield 17%).

C1) [[N,N-Bis[2-[bis(carboxymethyl)amino]ethyl]-O-(4-hydroxy-3-iodophenyl)-3,5-diiodo-L-tyrosinate(5-)]gadolinate(2-)] dihydrogen compound with 1-deoxy-1-methylamino-D-glucitol (1:2)

A 1 M aqueous solution of 1-deoxy-1-methylamino-Dglucitol (5.4 mL; 5.4 mmol) was dropped into suspension of compound B1 (B 22090) (1.94 g; 2 mmol) in H<sub>2</sub>O (100 mL), stirring until complete dissolution. A 0.33 M solution of GdCl<sub>3</sub> (6.2 mL; 2.05 mmol) was slowly added, maintaining the pH of the mixture at 6.5 by addition of a 1 M aqueous solution of 1-deoxy-1methylamino-D-glucitol through a pH-stat apparatus. After stirring for 1 h at room temperature the cloudy solution was filtered over Millipore (R) HA 0.45 m. The solution was loaded onto a column of Amberlite (R) XAD 16-00 polystyrene resin (200 mL) and the column eluted with  $\rm H_2O$  (1 L) followed by 3/1  $\rm H_2O/CH_3CN$  mixture (1 L). The fractions containing the complex were combined and concentrated to 150 mL. The resulting solution was filtered over Millipore (R) HA 0.45 m and evaporated to dryness to give the title compound (2.2 g; 1.45 mmol).

A solution of the pentaester from the previous preparation (10.7 g; 11.4 mmol) in CF<sub>3</sub>COOH (150 mL; 1.95 mol) was stirred over 18 h under  $N_2$  atmosphere. After evaporation (40°C; 2 kPa) the residue was dissolved in  $CH_2Cl_2$  (3 x 100 mL) evaporating the solvent 10 each time (40°C; 2 kPa). The crude was dissolved in a  $9/1~{\rm H_2O/CH_3CN}$  mixture and the solution was loaded onto a column of Amberlite (R) XAD 16-00 polystyrene resin. The column was eluted with H<sub>2</sub>O (1.5 L), then with 15 4/1 H<sub>2</sub>O/CH<sub>3</sub>CN, obtaining the product. concentration to 120 mL the resulting solution was filtered over  $Millipore^{(R)}$  HA 0.45 m and evaporated. The amorphous residue was suspended in CH3CN and the solvent evaporated. Such procedure was repeated until desired product was recovered by filtration (5.83 g; 20 8.9 mmol). Yield 78 %.

## **CLAIMS**

 Compounds of general formula (I), both in the racemic and optically active forms

5

10

in which :

R is H, or a linear or branched, saturated or unsaturated C<sub>1</sub>-C<sub>20</sub> alkyl, optionally interrupted by one or more -CH(OH)-, -CONH-, -NHCO-, -CO-, -CH(NH<sub>2</sub>)-, -SO-, -SO<sub>2</sub>-, SO<sub>2</sub>NH- groups and/or one or more N, O, S atoms, optionally substituted with one or more -COOH groups and/or amide or ester derivatives thereof, and in which said alkyl chain is interrupted or substituted by at least 2, which are independently the same or different, isolated or fused, cyclic L residues, with the proviso that, when some L residues are fused together, the resulting polycyclic unit comprises no more than 3 cyclic group, and in which

- 25 L is a carbocyclic or heterocyclic, saturated or unsaturated or aromatic cyclic unit, comprising from 5 to 6 atoms, optionally substituted by one or more X groups, which are independently the same or different, in which
- 30 X is OH, halogen, NH<sub>2</sub>, NHZ, N(Z)<sub>2</sub> , -OZ- , -SZ-, COZ, where the Z groups can independently be a

77

 $C_1-C_5$  linear or branched alkyl, optionally substituted with one or more -OH, -COOH or alkoxy groups,

or said X group is a -COOH group or a derivative thereof, such as an ester or an amido group, or an -SOZH group or an amido derivative of the same;

 $R_1$  is the same as R with the provisos that:

 ${\tt R}$  and  ${\tt R}_1$  cannot be at the same time  ${\tt H};$ 

when R is different from H, R<sub>1</sub> is H;

when R<sub>1</sub> is different from H, R is H;

15

as well as the complexes of the compounds of formula (I) with metal ions of atomic number from 20 to 31, 39, from 42 to 44, 49 and from 57 to 83 and the salts thereof with physiologically acceptable organic bases selected from primary, secondary or tertiary amines, or basic amino acids, or with inorganic bases the cations of which are sodium, potassium, magnesium, calcium or the mixtures thereof.

2. Compounds as claimed in claim 1, wherein R or  $R_1$  are selected from the following groups:

79

Compounds as claimed in claim 1, of general formula
 (II), both in the racemic and optically active forms,

HO O OH R O OH HO OH

5

15

in which R has the same meanings as in claim 1, but is different from H,

as well as the complexes of the compounds of formula (II) with metal ions of atomic number from 20 to 31, 39, from 42 to 44, 49 and from 57 to 83 and the salts thereof with physiologically acceptable organic bases selected from primary, secondary or tertiary amines, or basic amino acids, or with inorganic bases the cations of which are sodium, potassium, magnesium, calcium or the mixtures thereof.

- 20 4. Compounds as claimed in claims 1 to 3, wherein the complexed bi- or trivalent metal ion is selected from  $_{\rm Fe}(2+)$ ,  $_{\rm Fe}(3+)$ ,  $_{\rm Cu}(2+)$ ,  $_{\rm Cr}(3+)$ ,  $_{\rm Gd}(3+)$ ,  $_{\rm Eu}(3+)$ ,  $_{\rm Dy}(3+)$ ,  $_{\rm La}(3+)$ ,  $_{\rm Yb}(3+)$  and  $_{\rm Mn}(2+)$ .
- 5. Compounds as claimed in claims 1 to 3, selected from the group consisting of:
  - N,N-Bis[2-[bis(carboxymethyl)amino]ethyl]-O-(4-hydroxyphenyl)-3,5-diiodo-L-tyrosine;
  - N,N-Bis[2-[bis(carboxymethyl)amino]ethyl]-O-(4-hydroxyphenyl)-L-tyrosine;
- 30 N,N-bis[2-[bis(carboxymethyl)amino]ethyl]-0-(3,5diiodo-4-hydroxyphenyl)-3,5-diiodo-L-tyrosine;

80

```
- N,N-bis[2-[bis(carboxymethyl)amino]ethyl]-C-(3-
iodo-4-hydroxypenyl)-3,5-diiodo-L-tyrosine;
```

- N<sup>2</sup>, N<sup>2</sup>-Bis[2-[bis(carboxymethyl)amino]ethyl]-N,N[bis(phenylmethyl)]-L-glutamine;
- 5 N<sup>2</sup>, N<sup>2</sup>-Bis[2-[bis(carboxymethyl)amino]ethyl]-N, N- [dicyclohexyl]-L-glutamine;
  - $N^2$ ,  $N^2$ -Bis[2-[bis(carboxymethyl)amino]ethyl]- $N^6$  (diphenylacetyl)-L-lysine;
  - $N^2,N^2$ -Bis[2-[bis(carboxymethyl)amino]ethyl]- $N^6$ -
- 10 (triphenylacetyl)-L-lysine;

glucitol (1:2);

- $N^2$ ,  $N^2$ -Bis[2-[bis(carboxymethyl)amino]ethyl]- $N^6$  (dicyclohexylacetyl)-L-lysine;
- [N-[4-carboxy-4-[bis[2-[bis(carboxymethyl)amino]ethyl]amino]-1-oxobutyl]-L-tryptophane;
- [[N,N-bis[-2-[bis(carboxymethyl)amino]ethyl]-L-tryptophane.
  - 6. A paramagnetic chelate as claimed in claim 3, selected from the following group:
  - gadolinium complex of N,N-Bis[2-[bis(carboxymethyl)amino]ethyl]-O-(4-hydroxyphenyl)-3,5-diiodo-Ltyrosine salified with 1-deoxy-1-(methylamino)-D-
    - gadolinium complex of N,N-Bis[2-[bis(carboxymethyl)amino]ethyl]-O-(4-hydroxyphenyl)-L-tyrosine
- 25 salified with 1-deoxy-1-(methylamino)-D-glucitol (1:2);
  - gadolinium complex of N,N-bis[2-[bis(carboxymethyl)amino]ethyl]-O-(3,5-diiodo-4-hydroxyphenyl)-3,5-diiodo-L-tyrosine salified with 1-deoxy-1-(methylamino)-D-glucitol (1:2);

81

3,5-diiodo-L-tyrosine;

5

20

25

30

- gadolinium complex of  $N^2$ ,  $N^2$ -Bis[2-[bis(carbo-xymethyl)amino]ethyl]-N, N-[bis(phenylmethyl)]-L-gluta-mine salified with 1-deoxy-1-(methylamino)-D-glucitol (1:2);
- gadolinium complex of N<sup>2</sup>,N<sup>2</sup>-Bis[2-[bis(carboxymethyl)amino]ethyl]-N,N-[dicyclohexyl]-Lglutamine salified with 1-deoxy-1-(methylamino)-Dglucitol (1:2);
- gadolinium complex of [N-[4-carboxy-4-[bis[2-[bis(carboxymethyl)amino]ethyl]amino]-1-oxobutyl]-L-tryptophane salified with 1-deoxy-1-(methylamino)-D-glucitol (1:2);
- gadolinium complex of  $N^2, N^2$ -Bis[2-[bis(carboxy-methyl)amino]ethyl]- $N^6$ -(diphenylacetyl)-L-lysine

salified with 1-deoxy-1-(methylamino)-D-glucitol (1:2);

- gadolinium complex of  $N^2, N^2-Bis[2-[bis-(carboxymethyl)amino]ethyl]-N^6-(triphenylacetyl)-L-lysine salified with 1-deoxy-1-(methylamino)-D-glucitol (1:2);$
- gadolinium complex of  $N^2, N^2$ -Bis[2-[bis(carboxymethyl)amino]ethyl]- $N^6$ -(dicyclohexylacetyl)-L-lysine salified with 1-deoxy-1-(methylamino)-D-glucitol (1:2).
- gadolinium complex of [[N,N-bis[-2-[bis(carboxymethyl)amino]ethyl]-L-tryptophane salified with 1deoxy-1-(methylamino)-D-glucitol (1:2);
  - 7. Compounds as claimed in claims 1 to 6, further characterized in that the relaxivity values  $(r_1, r_2)$  in human serum reconstructed with Seronorm<sup>TM</sup> Human, at a concentration comprised from 0 to 1 mM, at 20 MHz and 39°C, is higher or the same as 15 s<sup>-1</sup>mM<sup>-1</sup>.

WO 98/05626 PCT/El<sup>9</sup>7/03997

- 8. A contrast diagnostic pharmaceutical composition for Magnetic Resonance Imaging comprising at least one of the complex chelates as claimed in claims 1 to 6 or a physiologically acceptable salt thereof.
- 5 9. A pharmaceutical composition as claimed in claim 8, for imaging of human or animal body organs and/or tissues, by use of Nuclear Magnetic Resonance.
- 10. The use of the complex chelates of the compounds as claimed in claims 1 to 6, or of the salts thereof, for the preparation of diagnostic formulations for M.R.I., for obtaining images of human or animal body organs and/or tissues by use of Nuclear Magnetic Resonance.
